

Environmental Protective System

✧ Why add the environmental protective system?

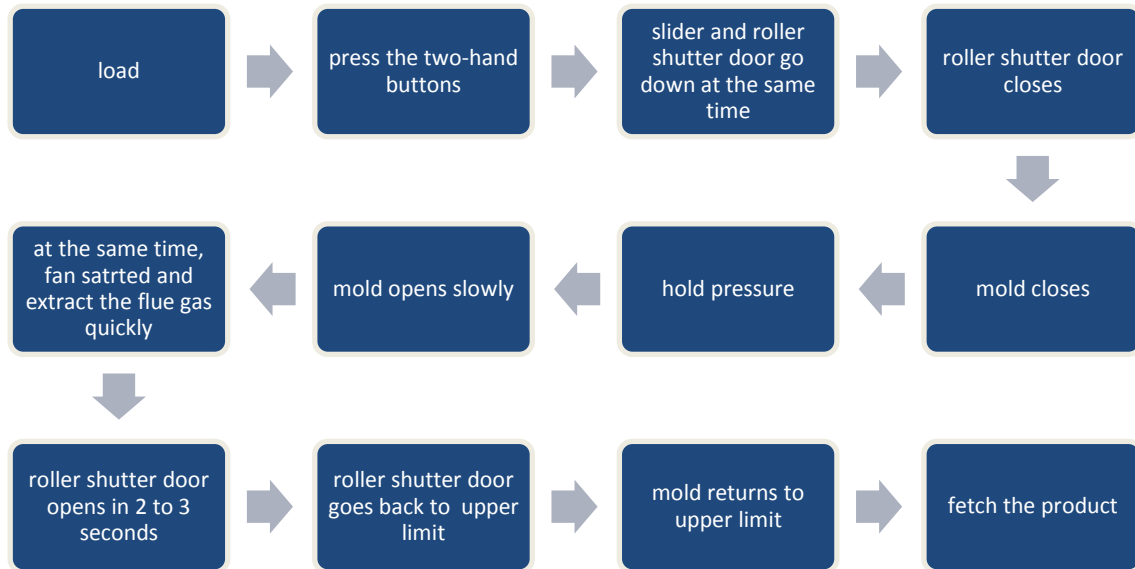

There is a large amount of hazardous substances in composite materials, especially at the beginning of raw material use and during the heating process, since harmful gas like NaOH will lead to the exceeding of VOC value in the production environment. So adding environmental protective system will create a good production environment by extract, filter and discharge the harmful gas, which will become one of the development trends of moulding press.

✧ What is included in the environmental protective system?

- full automatic servo roller shutter door at the front and back
- the left and right sides are totally-enclosed + accessible safety door
- pipeline at both sides
- fan at the back
- control program

✧ Action Flow

✧ What is the advantage of environmental protective system?

- collect the exhaust gas and guarantee the quality of workshop environment and the safety of the staff
- The exhaust gas will be discharged after being treated by environmental equipment so that the pollution can be reduced to protect the environment.
- The use of roller shutter door guarantees the production safety.
